1. GENERAL DESCRIPTION

The TEAC A-7030GSL has a heavy duty transport mechanism; three motors, solenoid operated, four high density ferrite heads provided (erase, record, playback and reverse playback); dual system automatic reverse, phase sensing signal or foil operated; 10-1/2 inch reel capacity, reel size selector provides optimum tape tension.

The AR-70GSL preamplifier circuits use IC and silicon transistors. Independent circuits are provided for recording, monitoring, VU meter amplifier and playback functions. Electrical assembly provides two level bias selection for conventional and low noise/high out tapes, dual scale VU meter, meter level switch for optimum recording accuracy with any type recording tape; full MIC/LINE mixing capability with indivudual mic/line amplifiers and indivudual level controls.

The basic design of the A-7030GSL is highly similar to the preceding A-7030GSL model. The A-7030GSL is a professional tape deck offering operating speeds of 7-1/2ips and 15ips. Normal head configuration is two track record and playback with an extra four track playback head. Sensing foil operated automatic rewind or stop operation is included. Incorporates all electrical assembly feature of the A-7010GSL exception equalization is for 7-1/2ips and 15ips tape speed.

The service manual provides adjustment and alignment procedures, schematic diagrams and parts replacement information with the proper procedures for obtaining necessary repair parts.

If adjustments or repair procedures are not clear or seem difficult to accomplish or should you desire more detailed technical information, please contact your nearest TEAC dealer, TEAC Corporation or affiliated corporations, addresses of which are printed in this manual.

Signal to Noise Ratio:	44dB or more at 3-3/4ips 46dB or more at 15, 7-1/2ips unweighted noise
Cross Talk Rejection:	Channel to channel at 1kHz/45dB or more Adjacent track at 125Hz/35dB
Erase Efficiency:	70dB or more at 7-1/2ips, 15ips(A-7030GSL)

These specifications are indispensible information and are required to service the equipment properly. They may differ slightly from those printed in the advertising brochures or the operation manual.

NOTE: As a result of continuing changes and improvements during the production run, minor differences may be found between early and later machines. Refer to manual change sheets for information concerning modifications.

3. EQUIPMENT REQUIRED

For proper adjustment and measurement, it is recommended that the following test equipment be available;

FOR MECHANICAL MEASUREMENT

SPRING SCALE:	0∿4 kilo-grams (0∿8 lbs) #5086025000 0∿300 grams (0∿10 oz) #5086026000
TEST TAPE:	TEAC YTT-2004 for 15ips TEAC YTT-2003 for 7-1/2ips TEAC YTT-2002 for 3-3/4ips
FLUTTER METER:	Meguro Model MK665B (preferred) or Sentinel FL-3D-1
DIGITAL FREQ. COUNTER:	Capable of 0 to 5kHz indication
TOOLS:	General, 2mm nut driver #5086014000 Hex head, Allen wrench #5086021000

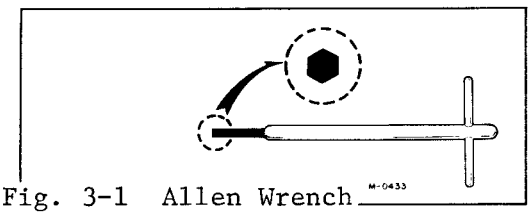

Fig. 3-1 Allen Wrench

FOR ELECTRICAL MEASUREMENT

TEST TAPE:	TEAC YTT-1004 for 15ips TEAC YTT-1003 for 7-1/2ips TEAC YTT-1002 for 3-3/4ips SCOTCH 203 and 150 for recording tests
EMPTY REEL	TEAC RE-702 (2" hub) TEAC RE-701 (4" hub) TEAC 10" reel
TEST SET:	TEAC M-826A test set
BAND PASS FILTER:	TEAC M-206A (1kHz)
AC/DC VTVM:	General purpose
RESISTOR:	Non inductive type 8Ω/1W
OSCILLOSCOPE:	General purpose

NOTE: Use of the TEAC M-826A test set is recommended. This set incorporates a LEVEL METER, Audio Oscillator, Channel Selecting Switch, Variable Attenuator, Monitor Speaker and Cables.

TEAC M-826A measures the RMS value of the Voltage (0dB=0.775V). Characteristics of this test set are similar to the standard VU-meter.

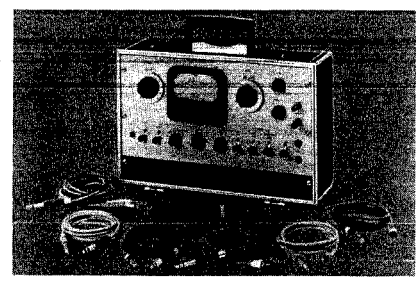

Fig. 3-1 TEAC Test Set M-826A

4. PARTIAL DISASSEMBLY

TAPE TRANSPORT REMOVAL

- Remove power cord and other connecting cords.
- Lay the equipment face down on a soft mat.
- Remove the two rear cover screws on the top of rear cover.
- Remove three upper screws on both sides of the case.
- Gently lift the case from the tape transport.

AMPLIFIER REMOVAL

- Remove two screws on both sides of the case.
- Slide the amplifier from case.

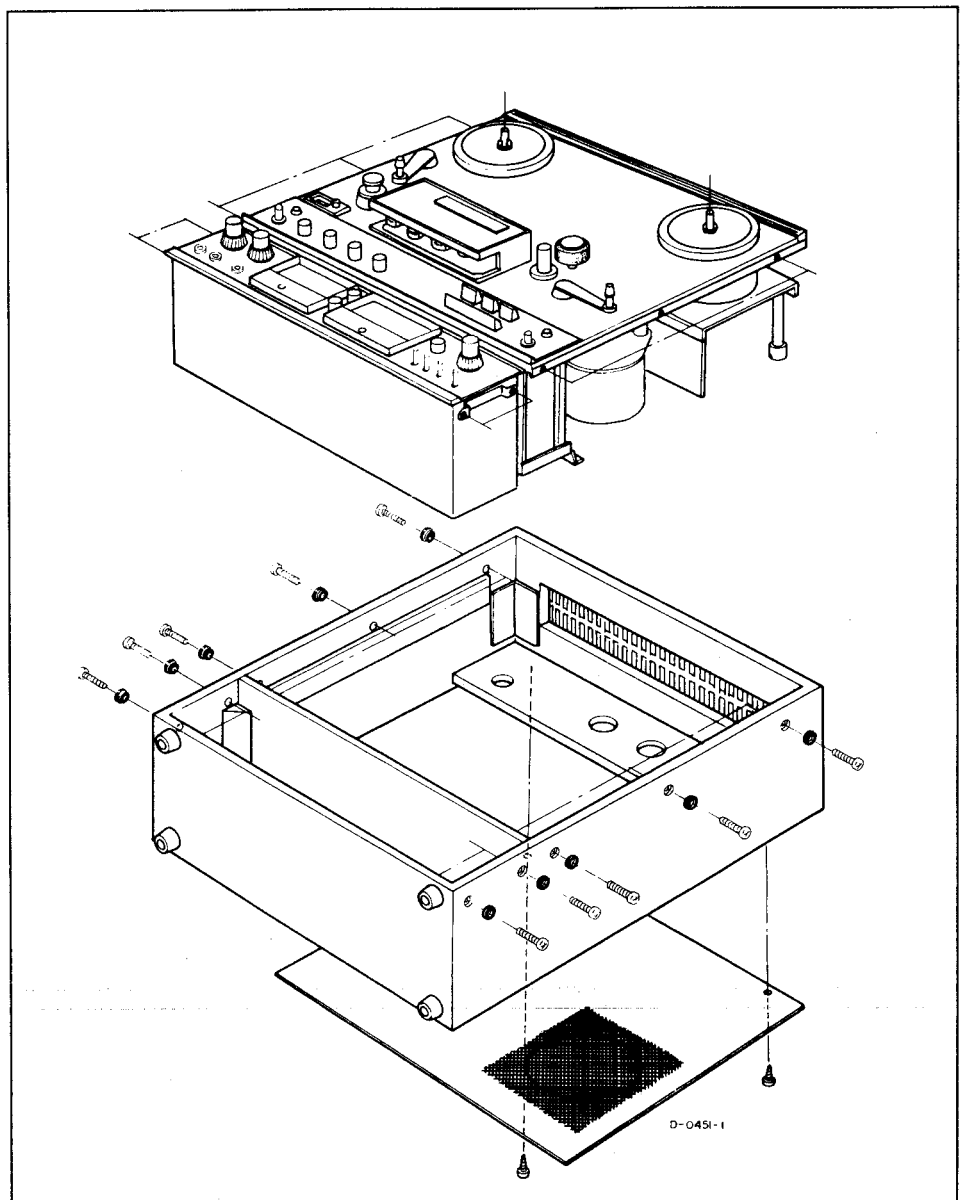

Fig. 4-1 Case Removal

LEFT TENSION ARM REPLACEMENT

- Unsolder two wires from terminal strip.
- Disconnect one end of the spring.
- Loosen allen screw and spring retaining pin then lift out tension arm.

  IMPORTANT: A special grease (MULTI DIA SS-10) must be applied during installation between the tension arm shaft and the bushing to maintain proper tension arm damping.

- To install, reverse the previous procedures.

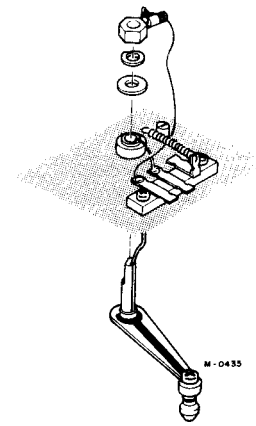

Fig. 4-2 Left Tension Arm

RIGHT TENSION ARM REPLACEMENT

- Disconnect one end of the spring.
- Loosen allen screw retaining the tension arm shaft, and gently lift out the tension arm.
- Apply "MORICOTE" (graphite-molybdenum based) to tension arm shaft and bushing during installation.
- After installation, check tension arm operation. It should operate freely and the thrust clearance should be minimum (secure but not binding).

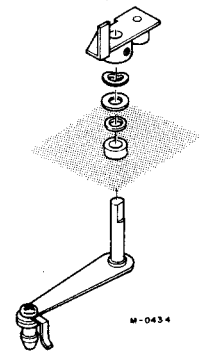

Fig. 4-3 Right Tension Arm

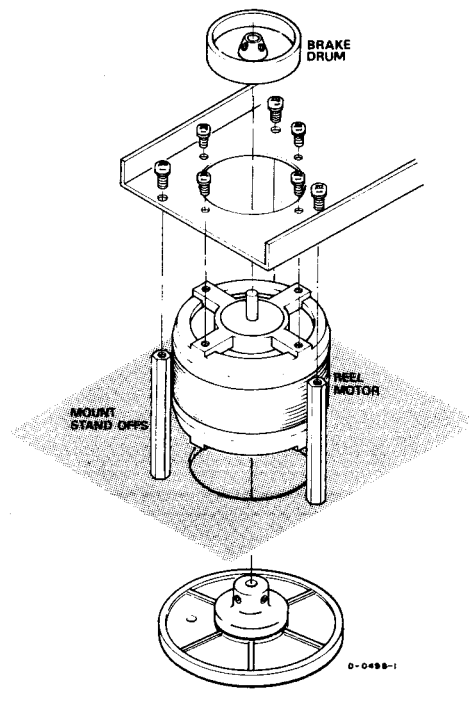
REEL MOTOR REPLACEMENT

- Use a special allen wrench (Fig.3-2). Access to the two reel table retaining screws is from the top of the unit (slots provided).
- Disconnect 34P connector from the reel motor assembly.
- Remove the reel motor assembly by removing four mounting screws.

  CAUTION: Extreme care must be taken not to damage PC board or relays when removing the reel motor assembly.

- Remove the brake drum after loosening the two allen screws on the motor shaft.
- Cut the four wires connecting the reel motor approx. 1" above the terminal.
- Remove the four screws mounting the motor.
- To reinstall reel motor, reverse above procedures. Use the wire remaining on the terminal for a guide in re-wiring the new motor.



CAUTION: While replacing, be careful not bend the brake bands. Do not get oil on the brake drum.

Fig. 4-4 Reel Motor

CAPSTAN ASSEMBLY REPLACEMENT

- Remove capstan dust cap on the front panel.
- Remove two screws mounting the thrust plate and pull away from the chassis.
- Remove capstan belt.
- Loosen two allen screws in the capstan flywheel and remove the flywheel.
- Remove three screws mounting the capstan assembly and lift the assy upward.
- Reverse the above procedures when installing the capstan assembly.
- During installation, apply a thin application of grease to the panel inside the thrust plate.

  CAUTION: A clearance of approx. 0.5mm must be maintained between the flywheel and capstan assembly.

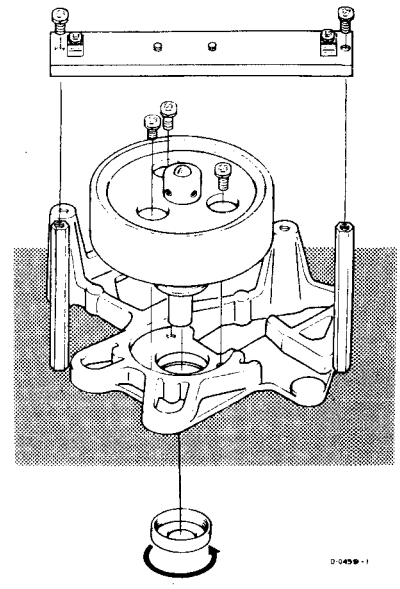


Fig. 4-5 Capstan Assembly

CAPSTAN MOTOR REPLACEMENT

- Remove the fan by loosening two hex screws.
- Remove the capstan belt, PC board and capstan pulley by loosening two hex set screws.
- Cut the six wires connecting the motor to the PC board.
- Remove the three slotted screws (studs bolt).
- Gently fold capstan motor assy and remove the four screws holding the motor on the pulley side. Then remove the four motors holding screws on the fan side.
- To reassemble, reverse the procedures.

  NOTE: After motor replacement, check position of capstan pulley on shaft for proper alignment with belt guide.

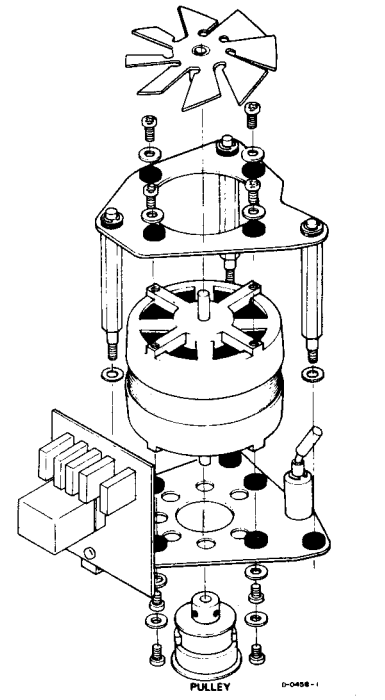

Fig. 4-6 Capstan Motor

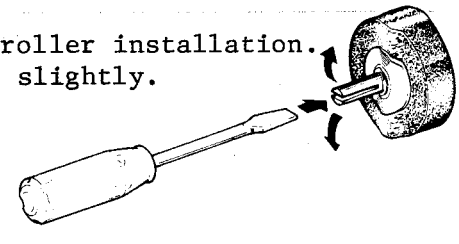
Check for a firm, Secure pinch roller installation.
If it is loose, spread the slot slightly.



HEAD REPLACEMENT

NOTE: Heads can be replaced individually or as a complete assembly. Azimuth adjustment (electronic) is not to be performed until all mechanical alignments have been performed. After replacing the heads, proceed to the next page for mechanical alignment.

CAUTION: All power must be removed from the unit when replacing heads to prevent transient pulses from passing through the heads. These may cause strong magnetization of the head material or damage the delicate winding.

HEAD ASSEMBLY REPLACEMENT

- Remove the head housing cover by loosening two hex screws on top of cover.
- Remove the four mounting screws indicated by the arrows in the diagram.
- Slide the assy out from the plug.
- Fit the original shielding plate onto the new head assy.
- Slide the new assembly onto the unit and secure the four screws.
- Proceed to the next page for mechanical alignment procedures.

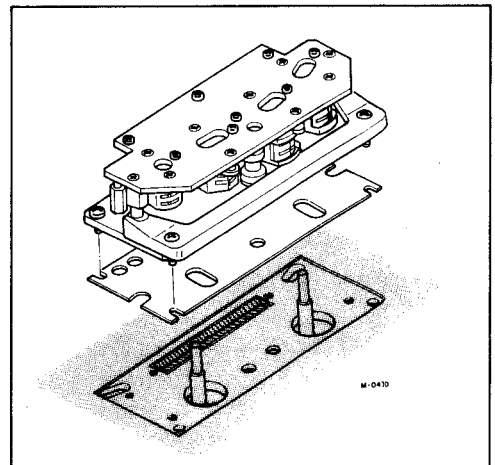


Fig. 4-7 Head Assembly

INDIVIDUAL HEAD REPLACEMENT

NOTE: All of the heads are indivudually mounted on the top base plate of the head assembly for easy accessibility and servicing.

- Remove head housing cover to expose head assy.
- To replace a single head, a special 2mm nut driver is required.
- Remove the two nuts on the defective head through the access hole provided to release the head from the mounting plate.
- Note the position of the head's wires on the circuit board and unsolder the defective head.
- **Using fig. 5-1 for reference, connect the new head to the circuit board.**
- Head installation mounting provides for either left or right positioning.
- Determine the proper position by adjusting the nuts to obtain a 90° angle between the tape and the head.
- Proceed to the next page for mechanical alignment procedures.

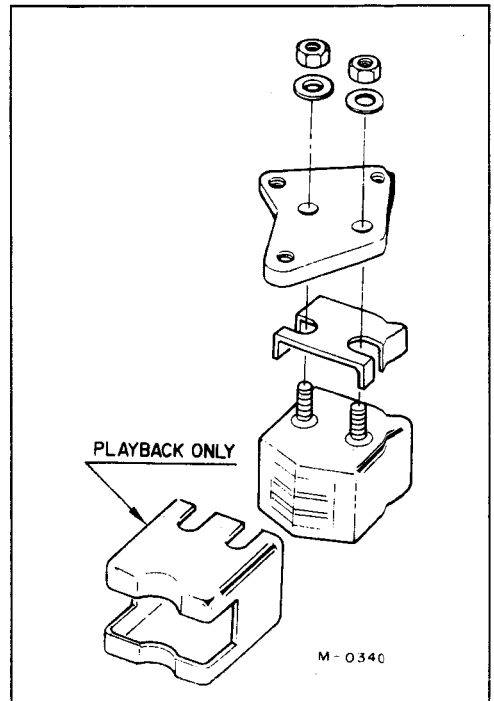

Fig. 4-8 Individual Head

5. HEAD MECHANICAL ALIGNMENT

NOTE: Head alignment is adjusted at the factory to very critical tolerances. Normally HEAD ASSEMBLY replacement will require only minor alignments or adjustments. Complete readjustment should only be necessary after an individual head is replaced. The adjustments are made as follows:

ERASE HEAD: The erase head pole should be above the edge of a threaded tape by the width of a heavy pencil line. Adjust the three screws indicated to obtain this height.

RECORD HEAD: The record head pole should be above the edge of a threaded tape by the width of a thin pencil line. Adjust the two screws indicated to obtain this height.

IMPORTANT: After completing the height adjustment make certain head surfaces are parallel with tape guide surfaces when viewed from the side.

PLAYBACK HEADS: The reverse playback head pole should be even with the bottom of the tape and the forward play head pole should be even with the top of the tape. Adjust the screws indicated.

NOTE: Refer to the figure below for locating the screws used in the preceding alignments. Azimuth adjustments are given in the section on MEASUREMENT AND ADJUSTMENT -ELECTRICAL-.

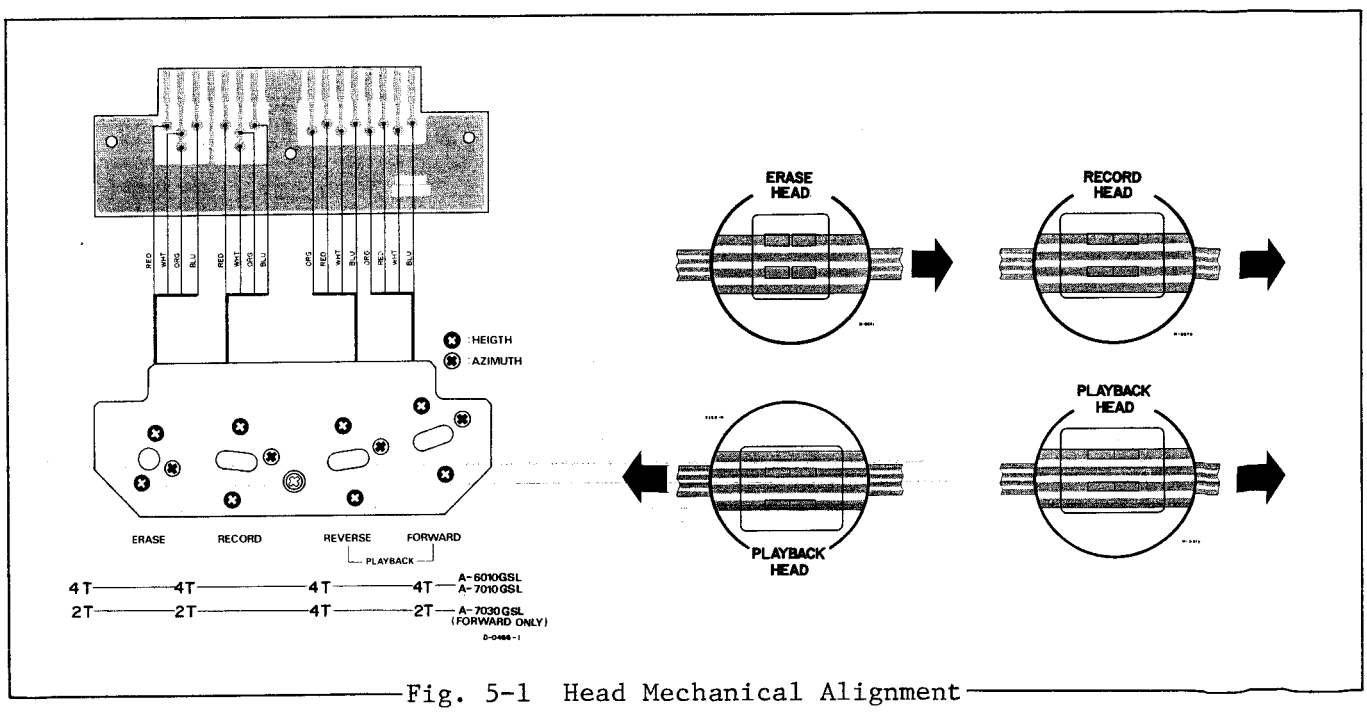

Fig. 5-1 Head Mechanical Alignment

PLAYBACK PERFORMANCE

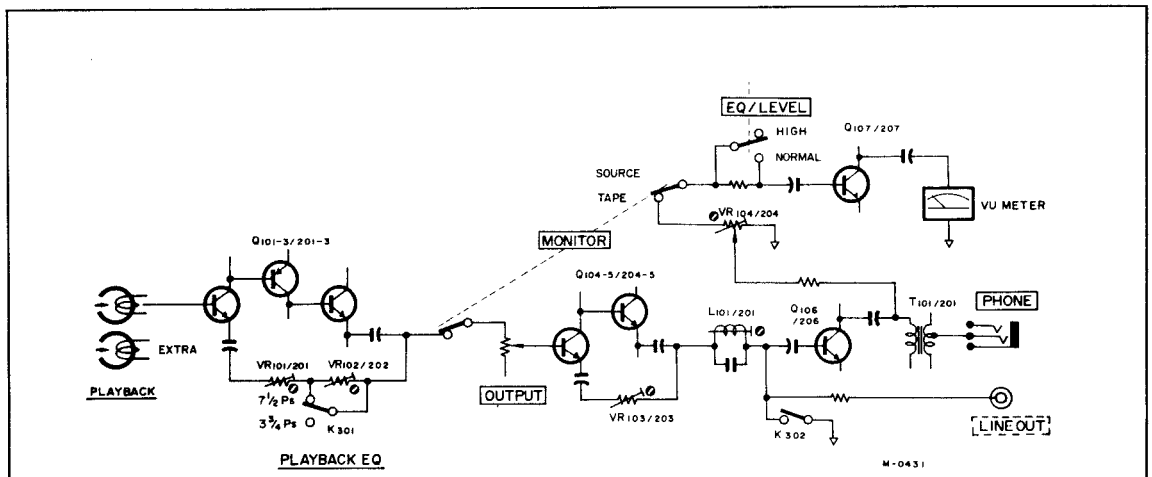

Fig. 7-1 Playback Circuit Simplified

PLAYBACK HEAD AZIMUTH ADJUSTMENT

Coarse Adjustment

1. Connect the test set to either LINE OUT jack.
2. Thread a TEAC test tape YTT-1003 on the unit with MONITOR switch to TAPE position.
3. Depress forward button (▶) and play the 15 kHz test tone in section 2 of the test tape.
4. Slowly rotate the azimuth screw (forward) until maximum indication is indicated on the level meter.

   NOTE: If during playback, a slight pressure on the heads results in a rise of the reading of the level meter, head MECHANICAL ALIGNMENT readjustments should be accomplished. (See section

Fine Adjustment

   CAUTION: Do not make large corrections during fine adjustment, turn the screw 1/4 of a revolution or less.

5. It is absolutely essential to accomplish the coarse adjustment before using this method to avoid phase errors larger than 45°.
6. Connect the test equipment as shown in Fig. 7-2.
7. Play a 10 kHz signal and adjust the azimuth screw until the oscilloscope shows that the signals are less than 45° in phase.
8. Secure the azimuth adjustment screw with LOCTITE and apply the above procedure to the remaining playback head.

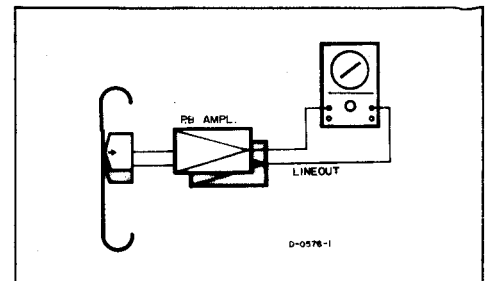

Fig. 7-2 Fine Adj. Set-up

SPECIFIED OUTPUT LEVEL SET

IMPORTANT: Unless otherwise specified, the EQ/LEVEL switch must always be in the HIGH position during measurement and adjustment.

9. Play the 400 Hz tone in section 1 of the test tape. This tone is recorded at operating reference level (1% of the THD level).
10. Turn the OUTPUT controls fully clockwise, and adjust VR-103/203 for -2 dB reading on the test set.
11. Then turn OUTPUT controls(C.C.W.) until a -8 dB reading is obtained on the test set. If equal VU meter reading cannot be obtained with both OUTPUT controls at 2 o'clock, readjust VR-103/203 slightly.

NOTE: This is the specified output level setting. Do not disturb this setting until the remaining adjustments have been completed.

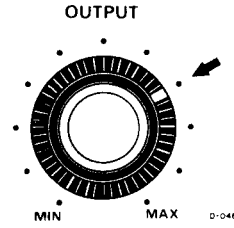

Fig. 7-3 Specified Set Position

VU METER CALIBRATION -PLAYBACK-

Place the EQ/LEVEL switch to the NORMAL position.

12. While playing the 400 Hz tone (1% THD) in section 1 of the test tape, adjust VR-104/204 for a reading of 0 VU on the VU meter.

HIGH level check: While playing back 400 Hz (operating reference level) signal, move the EQ/LEVEL switch from NORMAL to HIGH position. The VU meter should decrease 3 dB. This is a performance check only. After checking, keep the EQ/LEVEL switch in the HIGH position.

FREQUENCY RESPONSE AND THE PLAYBACK EQUALIZATION ADJUSTMENT

13. Play section 3 of TEAC Test Tape YTT-1003 at 7-1/2ips (which was recorded at 10 dB below the operating reference level). *On the A-7030GSL, Use YTT-1004 at 15ips.*
14. Compare the readings with the response limits given in fig. 7-4.
15. Adjust the equalization trimmer resistors VR-101/201 to obtain the flattest possible response within ±2 dB limits between 7.5 kHz and 10 kHz. *On the A-7030GSL, within from 7.5 kHz to 20 kHz.*

16. Play section 3 of TEAC Test Tape YTT-1002 at 3-3/4ips. (A-7010GSL only)
17. Compare the readings with the response limits given in fig. 7-4.
18. Adjust the equalization trimmer resistors VR-102/202 to obtain the flattest possible response within ±2 dB limits between 7.5 kHz and 10 kHz.

NOTE: During reverse play, the readings should be almost identical with forward play. However, do not made any adjustments of the trimmers during reverse play (A-7010GSL only).

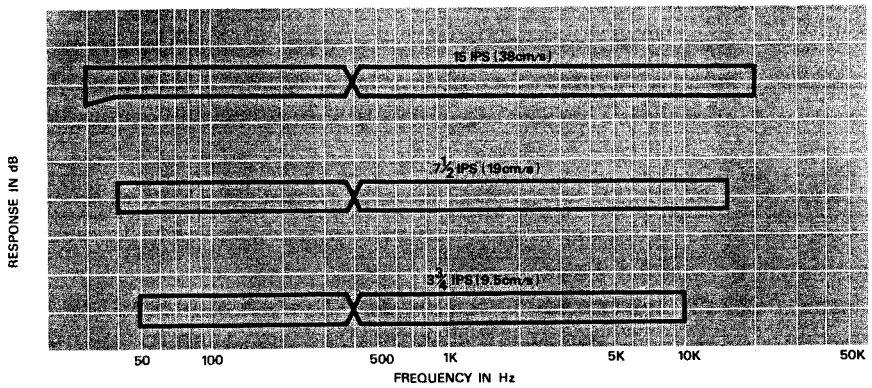

Fig. 7-4 Frequency Response Limits -Playback-

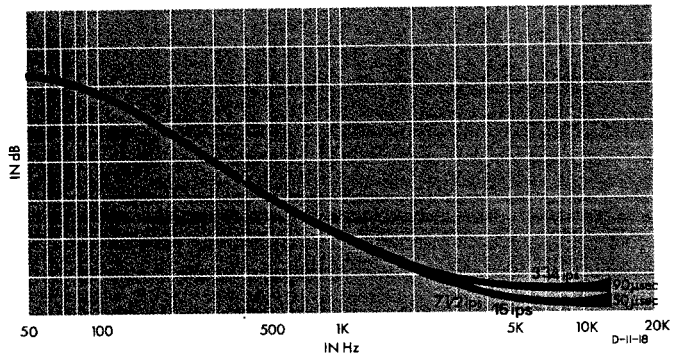

Fig. 7-5 Equalization Curves -Playback-

SIGNAL TO NOISE RATIO CHECK

NOTE: Values given are obtained using an unweighted level meter while the supply and take-up motors have voltage applied but are not rotating. The OUTPUT control should be at specified output position.

1. Thread a tape on the unit, leaving the tape outside the capstan and pinch roller. Tension arm should be in ON position.
2. Place the unit in the PLAY mode (▶) (the tape will not move).
3. The level meter connected to the LINE OUT jacks should indicate as listed below.

A-7030GSL: -56dB/15ips & 7-1/2ips
A-7010GSL: -56dB/7-1/2ips
-54dB/3-3/4ips

For example: -56 dB indicated corresponds to a signal to noise ratio of 48 dB (difference between residual noise -56 dB and the specified output level of -8 dB for 1% THD).

For a 3% THD signal to noise ratio, 6 dB is added, giving 54 dB (3% THD is 6 dB above 1% THD level).

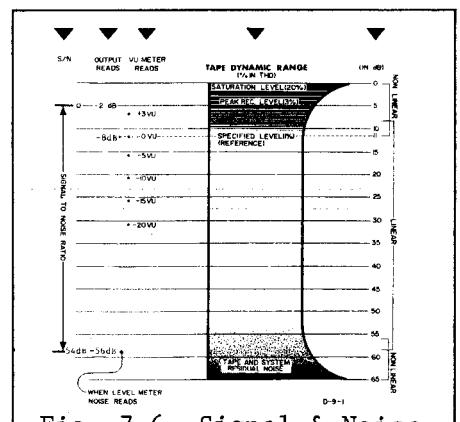

Fig. 7-6 Signal & Noise Computation

MONITOR AND RECORD PERFORMANCE

MINIMUM INPUT LEVEL ADJUSTMENT

IMPORTANT: The EQ/LEVEL switch must be in HIGH position.

LINE Input

1. Connect an AF oscillator to the LINE IN jacks.
2. Apply a 400 Hz signal at -18 dB.
3. Place the MONITOR switch in the SOURCE position and turn the LINE controls fully clockwise.
4. Adjust VR-105/205 to obtain the specified output level of -8 dB at LINE OUT jacks.

MIC Input

5. After adjusting VR-105/205, apply a 400 Hz signal at -70 dB to the MIC IN jacks.
6. Rotate the MIC controls fully clockwise.
7. The output should be -8 dB (specified output level).

NOTE: Mic input requires no adjustment, only an operational check. After completing the check rotate MIC controls fully counter clockwise to eliminate noise from MIC jacks or mic preamplifiers.

SPECIFIED INPUT LEVEL SET

8. Apply a 400 Hz signal at -8 dB to the LINE IN jacks.
9. Turn the LINE controls (c.c.w.) until a -8 dB reading is obtained on the level meter.

NOTE: Do not disturb the specified input level position of these controls until the remaining checks and adjustments are completed. The difference between the channels must not exceed 2 dB indicated on the level meter. If it is not within limits, VR-105/205 must be readjusted.

VU METER CALIBRATION -MONITOR-

10. With the same 400 Hz signal at -8 dB applied and the MONITOR switch in SOURCE, adjust VR-106/206 for 0 VU on the VU meters.

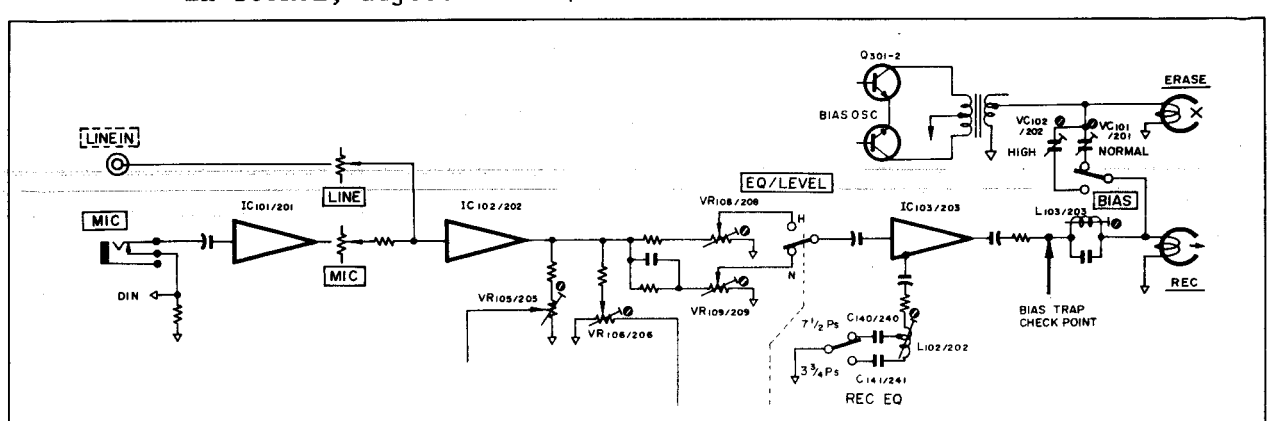

Fig. 7-7 Adjustment Parts Location -Monitor-

RECORD HEAD AZIMUTH ADJUSTMENT

Coarse Adjustment

NOTE: The effect of turning the azimuth screw will not immediately register on the level meter. A slight delay will be noticed. Therefore, rotate the screw slightly, and then pause to see the effect on the level meter.

1. Connect a Level Meter to the LINE OUT jacks and an AF oscillator to the LINE IN jacks.
2. Place the MONITOR switch to SOURCE and adjust the AF oscillator to obtain a signal of 15 dB below the specified output level. (The level meter will indicate -23 dB.)
3. Make certain that the LINE control is at the specified input level position, then set the AF oscillator to 10 kHz.
4. Thread a record test tape and place the unit in the record mode.
5. Change the MONITOR siwtch to the TAPE position.
6. Adjust the azimuth screw for maximum indication of the test set level meter.

Fine Adjustment

NOTE: It is absolutely essential to accomplish the coarse adjustment before using this method, to avoid phase error larger than 45°.

7. Connect the test equipment as shown in figure below.
8. Apply a 7.5 kHz signal at -23 dB to the LINE IN jacks and record this signal.
9. While recording carefully adjust the azimuth screw until the oscilloscope shows the signals to be in phase.
10. Secure the screw with a drop of LOCTITE.

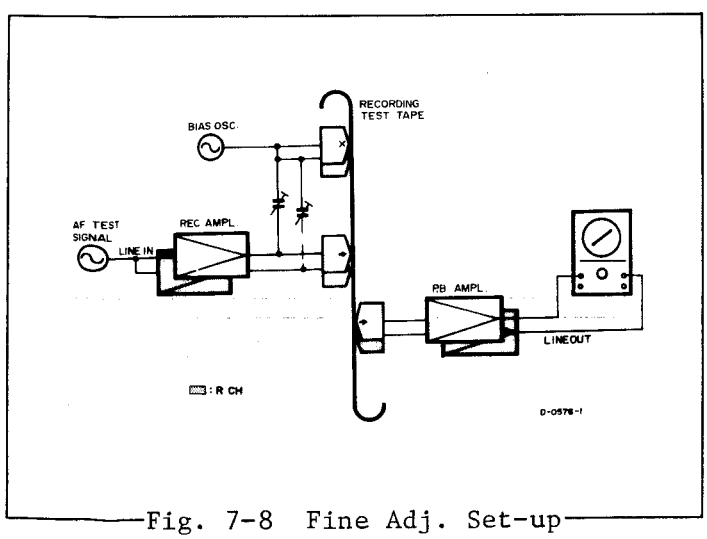

Fig. 7-8 Fine Adj. Set-up

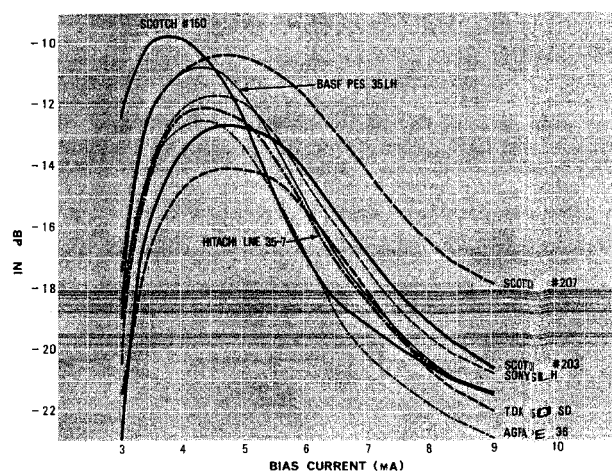

Fig. 7-9 Bias Current Characteristic

RECORD AMPLIFIER PERFORMANCE

IMPORTANT: Before making any adjustments on the record amplifier, be sure that all tests in the MECHANICAL HEAD ALIGNMENT, PLAYBACK and MONITOR PERFORMANCE sections have been accomplished and that all adjustments are correct. Optimum recording performance (Bias levels, recording levels and frequency response) depends upon tape characteristics. The TEAC A-7010GSL/7030GSL is factory preferred set for Scotch type 203 tape. Service data is based upon the use of Scotch 203 or a close equivalent tape.

BIAS TRAP ADJUSTMENT

NOTE: The bias trap tank circuit keeps the bias signal from reaching the record and monitor amplifier and under normal "no signal" conditions, voltage should not be present at the LINE OUT jacks.

NOTE: See figure for the location of these adjustments.

1. Thread a blank tape or block tension arm in ON position.
2. Place the MODE L·R switches up.
3. Place the BIAS switch to HIGH and place the unit in the record mode. Place the EQ/LEVEL switch in the HIGH position.
4. Connect a VTVM to the junction of L-103/203, R-145/245 and adjust L-103/203 for a min. reading.
5. Connect a VTVM to the LINE OUT jack. Adjust L-101/201 for a min. reading on the VTVM or oscilloscope.

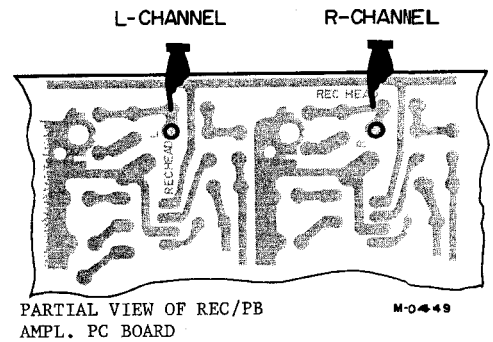

Fig. 7-10 Traps Check Point

BIAS ADJUSTMENT -Adjustments are accessible from the rear panel.

NOTE: These adjustments are only made at 7-1/2ips. The bias oscillator frequency is 100 kHz (±10 kHz).

HIGH bias position

1. Thread Scotch 203 recording test tape onto the unit.
2. Place the BIAS EQ/LEVEL switch to HIGH, the MONITOR switch to TAPE. Place the unit in the record mode.
3. With the level meter connected to the LINE OUT jacks, adjust capacitors VC-102/202 for a peak reading in each channel.
4. Then retard the capacitors clockwise until a decrease of 0.5 dB is indicated.

NORMAL bias position

5. Thread a Scotch 150 recording test tape onto the unit.
6. Change the BIAS switch to NORMAL and place the unit in the record mode. Adjust as above with VC-101/201.

RECORD LEVEL SET - Adjustments are accessible from the rear panel.

HIGH position

7. The OUTPUT and LINE controls must be at the specified level position.
8. Apply a 400 Hz signal at -8 dB to the LINE IN jacks.
9. Thread record test tape Scotch 203 on the unit, then set the BIAS and EQ/LEVEL switch to HIGH position.
10. Place the unit in the stereo record mode with the MONITOR switch in the TAPE position.
11. While recording this signal on the Scotch 203 record test tape, adjust VR-109/209 for a reading of 0 VU on the VU meters (-8 dB at the OUTPUT jacks).

    NOTE: REC level VR-109/209, 108/208 and VU meter calibration VR-106/206 will interact; after adjusting REC level, recheck VR-106/206 to ascertain that it is still correct.

NORMAL position:

12. Thread record Scotch 150 tape on the unit, then set the BIAS and EQ/LEVEL switch to NORMAL position.
13. Repeat step 7 and 8 above, and record this signal on the tape.
14. Adjust VR-108/208 for a reading of 0 VU on the VU meters.
15. After this adjustment, return the BIAS and EQ/LEVEL switch to HIGH position.

LEVEL VARIATION CHECK

Using TEAC M-826A level meter and Scotch 203 test tape, recording at the specified level setting with BIAS control in HIGH position, the output level variations should not exceed those shown in the chart below.

A-7010GSL	7-1/2ips:	0.5 dB at 400 Hz
		1.0 dB at 15 kHz
	3-3/4ips:	1.0 dB at 10 kHz
A-7030GSL	15ips:	1.0 dB at 20 kHz
	7-1/2ips:	1.0 dB at 15 kHz
		0.5 dB at 400 Hz

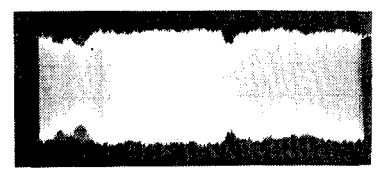

Fig. 7-11 Level Variation Wave Form

OVERALL FREQUENCY RESPONSE AND THE RECORDING EQUALIZATION ADJUSTMENT

IMPORTANT: To avoid saturation of the tape, these checks should be made at least 15 dB below the specified input level. Any bias signal feeding into the test equipment should be filtered out by adjusting the external bias trap. A broad band VTVM may be used on the output of the unit for this adjustment.

1. With the MONITOR switch at TAPE, and the OUTPUT and LINE controls at their specified level position:
2. Place BIAS,EQ/LEVEL switch in HIGH position, thread Scotch 203 record test tape on the unit.
3. Record test signals(approximately 30 seconds each)of a variety of frequencies: 50, 100, 250, 400Hz; 1, 2.5, 5, 7.5, 10, 15, 20 kHz at 7-1/2ips or 15ips.
4. Repeat step 3 at 3-3/4ips with frequencies from 40 Hz to 10 kHz.
5. Compare the outputs with the frequency response chart in figure. The level variation should not exceed ±0.5 dB at the 400 Hz reference point, ±1.5 dB at 15 kHz. At 3-3/4ips, you may see up to ±2 dB at 10 kHz.
6. If adjustment is required, adjust L-102/202 at 7-1/2ips (on the A-7030GSL, 15ips). If the coil adjustments do not bring the response within limits, then adjust C-140/240 at 7-1/2ips (on the A-7030GSL, 15ips), and C-141/241 at 3-3/4ips (on the A-7030GSL, 7-1/2ips). Make these adjustments so that you obtain the most level response across the spectrum in reference to 400 Hz.
7. Repeat steps 3, 4 and 5 with Scotch 150 tape and set the BIAS switch to NORMAL position. Response should be flat as shown before the dotted portion of the chart.

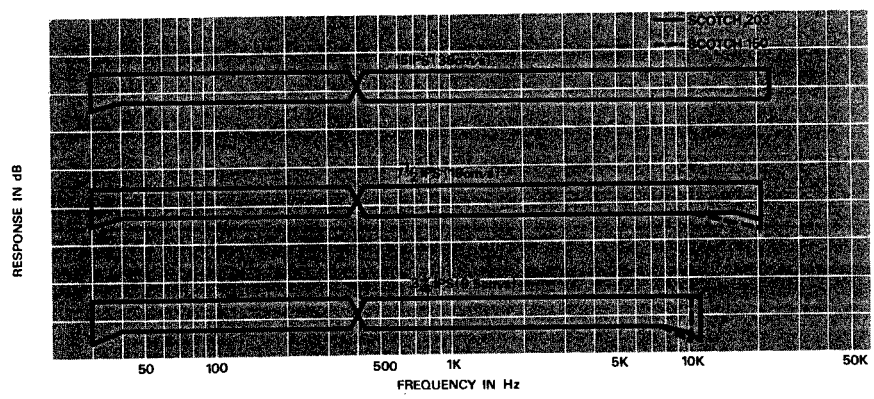

Fig. 7-12 Frequency Response Limits -Record-

OVERALL SIGNAL TO NOISE RATIO

IMPORTANT: Clean and demagnetize the heads before proceeding. It is extremely important that all tests described in the proceeding paragraphs have been completed and that all controls adjusted are left unaltered.

1. Thread a record test tape Scotch 203 on the unit.
2. Remove the AF oscillator from the LINE IN jacks.
3. Place the unit in the RECORD mode with no signal applied.

NOTE: Noise readings, when taken while recording, may be affected by the bias signal which could be leakings through. **It is therefore good practice torewind the "no signal" recorded section and take the noise reading during playback.**

4. Note the point on the index counter where recording begins.
5. Rewind the tape and play it back.
6. **The noise level as indicated on the test set level meter should be as indicated in the chart below.**

NOTE: Bias, erase and playback amplifier noise are all included in this measurement. All frequencies between 40 Hz and 20 kHz are measured unweighted.

MODEL	TAPE SPEED	LEVEL METER READING
A-7010GSL	3-3/4ips 7-1/2ips	-46dB or less -48dB or less
A-7030GSL	7-1/2ips 15ips	-48dB or less -56dB or less

ERASE EFFICIENCY CHECK

NOTE: To measure erase efficiency, a 1 kHz band pass filter (TEAC M204 CL filter) must be used.

Due to the high level of this signal, it is recommended that only a short recording be made (approximately 20 seconds) to prevent damage to the VU meter.

1. Apply a 1 kHz signal at 0 dB to the LINE IN jacks.
2. Place the unit in record mode and record this signal.
3. Rewind the recording to the beginning and remove the AF oscillator from the LINE IN jacks.
4. Place the unit in record mode and record over this portion of tape again with no signal applied.
5. Rewind the tape to the starting point. Connect the band pass filter to the LINE OUT jacks. Connect the test set leads to the filter.
6. Play the erased portion of the tape.
7. The level meter should indicate -70 dB or more on each channel.

SPECIAL CIRCUIT

PHASE SENSING CIRCUIT SYSTEM A-7010GSL only

The phase sensing reverse utilizes a separate amplifier located on the bottom of the A-7010GSL transport section.
When the SIGNAL RECORD and (▶) buttons are depressed, the AC line frequency (50 or 60 Hz) signal is recorded on the tape at a level of approximately +4∿10 dB. This signal, however, is recorded out of phase between the left and right channels since one of the record head poles is electrically reversed during this mode. During playback with the AUTO REVERSE switch ON position, the record heads act as the sensing device and are connected out of phase as they were during the recording of the reversing signal.
Because the heads are now out of phase in respect to the normal audio signals they generate very little or no output since the signals tend to cancel each other out. However, when the previously recorded, out of phase, reversing signal reaches the recording head it is now in phase in respect to the record head and generates a signal which is amplified, rectified and utilized to energize the reverse relay.
It is feasible that a strong signal with no counterpart on the other channel to cancel it out could cause the recorder to reverse. However, proper adjustment of the reversing amplifier sensitivity control will eliminate this possibility.
It must be understood that the reversing signal is recorded at such a high level that normal signals do not approach this level.

Phase Sensing System Adjustments:

1. Thread a blank tape Scotch 203 on the recorder and set MONITOR switch to TAPE, TAPE SPEED switch to 3-3/4ips.
2. Place the MODE L·R switches in the UP position.
3. Place the AUTO REVERSE switch in the ON position and set VR-1 to full counter clockwise.
4. Depress the SIGNAL RECORD and the (▶) button for approximately 2 seconds.
5. Rewind the tape to the start of the recorded signal and press the (▶) button.
6. **While playing this signal, advance VR-1 until the recorder stops and reverses operation.**
7. Rewind the tape once more and check to see if the recorder stops and reverses, then increase the sensitivity of VR-1 slightly.

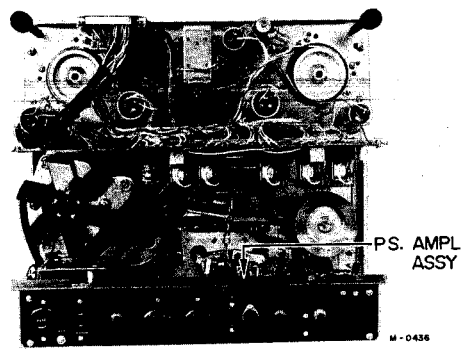

Fig. 7-13 Location of PS Amplifier

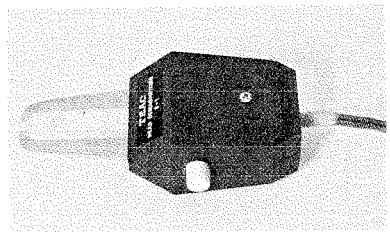
8. PREVENTIVE MAINTENANCE

The inner mechanism of the TEAC A-7010GSL/7030GSL is designed to require a minimum of maintenance. However, for optimum operation and long life, frequent cleaning of the tape path, sensing post, tension arm, tape guides, heads, capstan and pinch roller is a necessity. Do not neglect these easy procedures. If possible, they should be done before each recording session and after approximately 50 hours of playback use.
The following maintenance procedures are to be carried out after parts replacement, after extended periods of use or at overhaul. When installing new parts always clean the mechanism thoroughly using the TEAC Cleaning Kit.

TEAC MAINTENANCE EQUIPMENT

TEAC TZ-261
Cleaner

TEAC TZ-255
Oil Kit



TEAC E-1
Head Demagnetizer

DEMAGNETIZATION: Metal parts in contact with the tape (except erase head) will become magnetized after long periods of use. Magnetization of record/playback heads causes noise in recording and reproduction. Heads should be demagnetized at every 50 hours of use, and before any important recording is done. Refer to Operating Instructions.

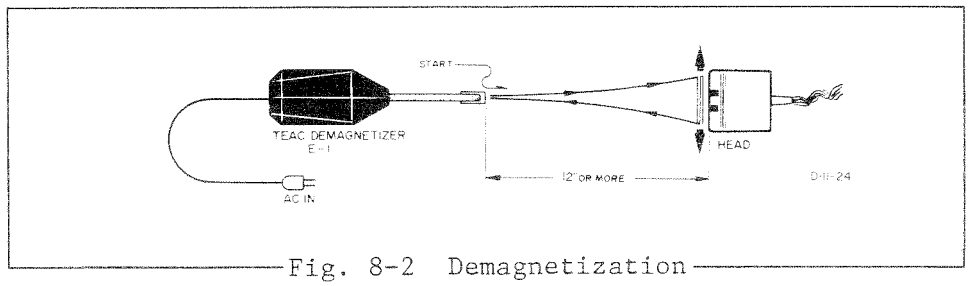


Fig. 8-2 Demagnetization

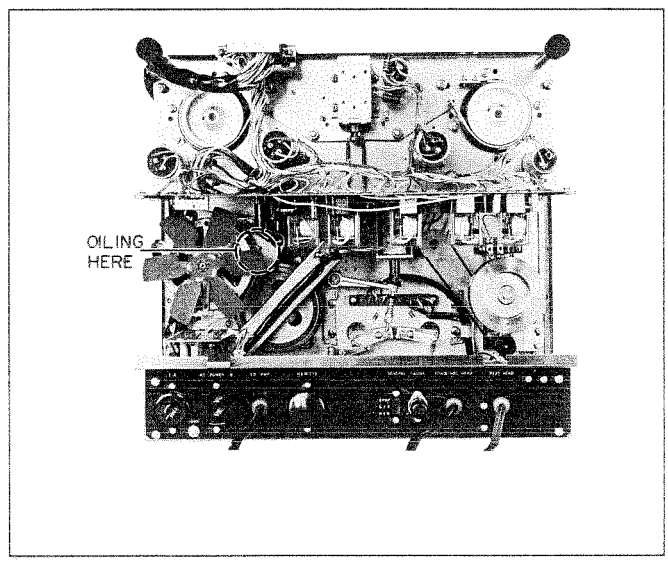

LUBRICATION: Under normal conditions the unit will not require lubrication. Most of the bearings and bushings are of the oil less type. Since there are many rubber parts in the transport mechanism, excessive or improper lubrication could cause problems. If lubrication is required, the following points should be lubricated;

Capstan bushing, pinch roller shaft ..... 1 drop
Capstan motor .....2∿4 drops in the plastic tubes

NOTE: The reel motor and impedance roller assembly are permanently lubricated with sealed ball bearing and require no lubrication.

Capstan motors should be lubricated immediately after use while still warm. After oiling motors keep the unit in the vertical position for 2∿3 hours to allow thorough absorption of oil.

CLEANING: If excess oxide accumulates on the surface of tape path components, normal operation and characteristics cannot be expected. Periodic cleaning should be done with proper cleaning materials. Refer to Operating Instructions.

9. TROUBLE SHOOTING CHART

NOTE: Our investigation into apparent malfunctions for which owners bring their machines into our repair shops has shown that an actual mechanical defect occurs in very few cases. Usually the indicated defect is as a result of improper operation of the machine, improper cleaning or lack of minor maintenance, or inadequate supplementary or associated equipment.
If your unit fails to perform properly, refer to the handbook of operation, clean and lubricate as per the instructions. Carefully check auxiliary or associated equipment before disassembling the machine or bringing it to the repair shop or service center. Close adherence to the maintenance, cleaning, lubricating and demagnetizing procedures outlined in the owners handbook will result in a long service life and optimum performance of your unit.

MALFUNCTION	POSSIBLE SOURCE	CORRECTIVE PROCEDURE
Capstan fails to turn. *Right tension arm ON position.*	Capstan belt off.	Replace belt.
	Line fuse F-2.	Replace fuse.
	Shut off SW S-13(S-11)	Check shut off SW.
	Motor cap. C-3	Replace capacitor.
	TAPE SPEED SW S-3	Check switch S-3.
	Rev. relay K-9	Check contacts.
	Capstan assy	Check capstan shaft.
Pinch roller sails to contact capstan shaft in play mode. *Depress ▶ button.*	REMOTE cont. jumper plug not installed or loose J-3.	Secure jumper plug.
	STOP SW S-17 (S-15) (K-4-a)	Check STOP SW.
		Check relay contacts.
	PAUSE connector plug not installed or loose.	Insert PAUSE plug.
	K-3a (K-6d)	Check relay contacts.
	Capstan solenoid	Replace solenoid.
		NOTE: The normal DC resistance of solenoid is 1.8Ωk .
Reel motor doesn't rotate in play mode.	K-1(a,b)K-2c(K-2a,K-3a)	Check relay contacts or replace.
	(S-2 REEL SW)	Check REEL SW.
	R4∿5 resistors	Check R4∿5 resistors.
	Motor cap. C-4∿5(C-6∿7)	Check motor capacitor or
	Brake solenoid	replace.
		NOTE: Normal brake solenoid resistance is 1.1 kΩ.
Auto-reverse, stop, rewind and repeat does not function with sensing foil.	Sensing foil length too short.	Foil should be 1/2 inch long.
	Sensing post dirty.	Clean sensing post.
Will not reverse play (A-7010GSL only)	REV relay K-5,K-6,K-9	Check relay contacts or replace.
Pinch roller 4 second delay faulty (A-7010GSL only)	R-10,C-8,K-2 delay relay (R-9,C-9,K-6 delay relay	Check components or replace.
Fast forward or rewind mode inoperative.	K-5,K-3(K-2,K-6,K-1)	Check relay contacts or replace.
	REEL SW S-2	
	R-7	

TROUBLE SHOOTING CHART CONTINUED

MALFUNCTION	POSSIBLE SOURCE	CORRECTIVE PROCEDURE
Tape speed not normal or excessive wow and flutter.	Capstan belt on wrong pulley steps.	Corrective belt step position.
	Oil on belt, pinch roller.	Clean belt and flywheel.
	Pinch roller pressure.	Check pressure and adjust.
Tape damage.	Reel height incorrect.	Check reel height.
	Excessive take-up torque.	Check for torque.
	Brake torque not even.	Check for brake torque or replace the solenoid.
No playback	MONITOR SW.	Verify SW & controls position.
	OUTPUT control.	
	Playback heads dirty.	Clean head with TEAC cleaner.
	Play head connector loose or out.	Check connection.
	Playback ampl.	Check ampl.
	Take (no signal on tape)	Change tape.
Playback noise or loss of high freq.	Faulty connections.	Reconnection.
	Head relay K-8.	Check contact or replace.
	Head dirty.	Clean head with TEAC cleaner.
	Playback EQ.	Readjust EQ. properly.
No record and/or no erase.	Erase, record head dirty.	Clean head with TEAC cleaner.
	Auto-reverse SW in ON.	Make sure SW position.
	Record relay K-7.	Repair or replace.
	Interconnection cables loose or out.	Check for plug.
	REC ampl. Bias OSC.	Check or repair.
Loss of high freq. during record.	Head dirty.	Clean head with TEAC cleaner.
	Back tension.	
	Bias adj.	Check bias and readjust properly.
Channels not balanced during record.	Head dirty.	Clean head with TEAC cleaner.
	Bias adj.	Check bias adjustment.
	REC. level calibration.	Check REC. CAL.
	Head alignment.	Check head alignment.
Channel unbalanced during playback.	Tape faulty.	Change tape.
	Head dirty.	Clean head.
	Head alignment.	Adjust for head alignment.
	OUTPUT control.	Check for control set position.
	VU meter.	Check meter sensitivity.
	Playback level calibration.	Adjust PB calibration.

WARRANTY

Your TEAC equipment has been manufactured under strict quality control. Its normal operation is under warranty. However, warranty terms may vary with the country (area) in which it was purchased and for different models of equipment.
The warranty terms are fully described on the warranty card.
Please read the card for complete details.

PACKING FOR SHIPMENT

SHIPPING INSTRUCTIONS

If the unit is to be sent back to the TEAC factory (service department) for repair, carefully pack as shown below.

REPLACEMENT INFORMATION

Replacement parts are available through your nearest TEAC dealer or directly from the TEAC office.
Changes are constantly being made to make TEAC products better and more reliable.
Therefore, when ordering parts, always include the following information:

MODEL *SERIAL NO.* *REF.NO.* *PARTS NO.* *DESCRIPTION*

P.S. AMPL. CIRCUIT CHANGE

The sensing post of the automatic reverse circuit has been the source of noise when using back-coated tapes, such as SONY SLH-BL, Scotch #206 or 207, and others. A new printed circuit board assembly is now being used to eliminate this problem. (See diagram.) If the customer desires, his older model may be modified to include this change. Order part #50491040

EXPLODED VIEW 5, BELOW THE MAIN CHASSIS

COUNTER IDLER PULLEY CHANGE

In the A-7010GSL and A-7030GSL, the problem of friction noise from the Counter Idler Pulley high-speed rotation in FAST FWD or FAST REW operation has been eliminated by a newly designed Counter Idler Pulley. The ID of the pulley's center has been reduced from 5ϕ to 3ϕ and the OD of the Idler Pulley Shaft has likewise been reduced to 3ϕ.

When replacing either the Idler Pulley Shaft or the Counter Idler Pulley, they must both be replaced at the same time, due to the incompatibility between the old and new diameters. This applies especially to the older models (before this change was incorporated) and it is also a good practice to replace both parts during any replacement to provide uniform wear characteristics between the parts.
